Video Conferencing and Collaboration Tools

Teams or Zoom audio and video problems, meeting access, screen sharing, file sharing

Default priority: P3 Medium
(P2 if an executive meeting is about to start)

Target response / resolution: Respond in 10 min / resolve in 1 business hour

Handled by: Tier 1

Scope

Use this instruction for problems joining or hosting online meetings, with audio or video devices, or with collaboration platforms such as Teams, SharePoint, and OneDrive.

Related instructions: WI-16 Meeting Room AV, WI-06 Network, WI-03 Laptops and Peripherals

Common symptoms

- Cannot join a meeting, or the link does not open
- No sound, echo, or microphone not detected
- Camera not working, or poor video quality
- Screen sharing fails, or files will not sync or open

Information to collect

- Which platform and the meeting link or time
- Whether the issue is audio, video, sharing, or sign-in
- Headset, camera, and browser or app version
- Whether others in the same meeting are affected

Resolution steps

- 1 Check the service status.** Look at the platform status page. If there is a vendor outage, update the ticket, inform the user, and advise a backup channel such as a phone dial-in.
- 2 Check sign-in and version.** Confirm the user is signed in with the work account and the app is on the current version. Restart the app or try the web version.
- 3 Check audio and video devices.** In the app's device settings, select the correct microphone, speaker, and camera. Check the operating system privacy settings allow the app to use them, and that the device is not muted.
- 4 Test other connections.** Close heavy apps, switch from Wi-Fi to wired, or leave the VPN if the platform allows. Check the user's bandwidth for slow video.
- 5 Fix sharing and permissions.** For screen sharing, check the meeting policy and operating system screen-recording permissions. For file problems, check the sharing link and the user's permission on the site or folder.
- 6 Fix sync errors.** For OneDrive or SharePoint sync issues, check the sync client status, free disk space, path length, and invalid file names. Reset the sync client if needed.
- 7 Test and confirm.** Run a test call with the user, and confirm that the user can be heard, seen, and can share their screen.

Escalate when

- Platform-wide outage, or a policy setting needs a change by the collaboration team
- Meeting room equipment faults (raise with facilities or the AV team)
- Data sharing concerns, such as files shared with the wrong people (see WI-10)

Resolution and closure

- Record the cause (device, network, account, platform) and the fix
- Share the user guide for meeting audio and video checks
- Close after the user confirms the issue is resolved

Quick troubleshooting reference

Symptom	Likely cause	What to do
No audio in the meeting	Wrong output device, muted, or permissions	Select the right speaker and microphone, unmute, and check the OS privacy settings.
Camera not detected	Used by another app, disabled, or driver	Close other apps, enable the camera in settings, and update the driver.
Cannot join the meeting link	Not signed in with the work account, or external policy	Sign in again, try the web version, and check guest access rules.
Screen sharing fails	Missing permission or policy block	Grant screen recording permission and check the meeting policy.
Poor video quality	Bandwidth or CPU load	Close heavy apps, use wired, turn off video background effects.

Suggested wording for the user

Open	<i>"Is the meeting about to start? If so, let us get you in first with the web version, then fix the app after."</i>
During	<i>"Please click the speaker icon in the meeting settings. Which device is selected?"</i>
Close	<i>"You can be heard and seen now. If it happens again, join by phone as a backup and call us."</i>

Good practice

Do

- Offer a quick workaround first when a meeting is imminent
- Check the platform status page
- Test with the user before closing
- Share a short audio and video checklist

Do not

- Do not change tenant-wide meeting policy without approval
- Do not ignore recurring failures
- Do not forget guest or external access rules
- Do not make users reinstall during a live meeting

Worked example

An executive cannot be heard at the start of a board call.

Ticket note field	Entry
Issue reported	Participants cannot hear the executive. Meeting started 5 minutes ago.
Checks performed	Microphone set to a disconnected headset.
Cause	Wrong input device selected after undocking.
Action taken	Selected the laptop microphone, then set the headset as the default after the call.
Result	Audio restored within two minutes. Follow-up call made to confirm.

Analyst checklist

- | | |
|--|--|
| ☐ Check the service status | ☐ Fix sync errors |
| ☐ Check sign-in and version | ☐ Test and confirm |
| ☐ Check audio and video devices | ☐ Ticket note completed using the standard template |
| ☐ Test other connections | ☐ User confirmed the issue is resolved |
| ☐ Fix sharing and permissions | |

Preventing repeat tickets

- Set default devices through policy where possible
- Run a pre-meeting test for key events
- Keep the apps updated
- Train users on audio settings
